研究背景 (Background)

Responsible for the deacetylation of lysine residues on the N-terminal part of the core histones (H2A, H2B, H3 and H4). Histone deacetylation gives a tag for epigenetic repression and plays an important role in transcriptional regulation, cell cycle progression and developmental events. Histone deacetylases act via the formation of large multiprotein complexes. May play a

role in smooth muscle cell contractility.

研究领域 (Research Area)

Epigenetics and Nuclear Signaling
