研究背景 (Background)

This gene encodes one of two sphingosine kinase isozymes that catalyze the phosphorylation of sphingosine into sphingosine 1-phosphate. Sphingosine 1-phosphate mediates many cellular processes including migration, proliferation and apoptosis,

and also plays a role in several types of cancer by promoting angiogenesis and tumorigenesis. The encoded protein may play a role in breast cancer proliferation and chemoresistance. Alternatively spliced transcript variants encoding multiple isoforms have been observed for this gene. [provided by RefSeq, Aug 2011], alternative products: Experimental confirmation may be lacking for some isoforms, catalytic activity: $\text{ATP} + \text{sphinganine} = \text{ADP} + \text{sphinganine 1-phosphate}$, catalytic activity: $\text{ATP} + \text{sphingosine} = \text{ADP} + \text{sphingosine 1-phosphate}$, cofactor: Magnesium, function: Catalyzes the phosphorylation of sphingosine to form sphingosine 1-phosphate (SPP), a lipid mediator with both intra- and extracellular functions. Also acts on D-erythro-dihydrosphingosine, D-erythro-sphingosine and L-threo-dihydrosphingosine, similarity: Contains 1 DAGKc domain,
