研究背景 (Background)

This gene encodes a member of the family of adenylate cyclases, which are membrane-associated enzymes that catalyze the

formation of the secondary messenger cyclic adenosine monophosphate (cAMP). Mouse studies show that adenylate cyclase 4, along with adenylate cyclases 2 and 3, is expressed in olfactory cilia, suggesting that several different adenylate cyclases may couple to olfactory receptors and that there may be multiple receptor-mediated mechanisms for the generation of cAMP signals. Alternative splicing results in transcript variants. [provided by RefSeq, Nov 2010], catalytic activity: ATP = 3',5'-cyclic AMP + diphosphate., cofactor: Binds 2 magnesium ions per subunit., enzyme regulation: Insensitive to calcium/calmodulin. Stimulated by the G protein beta and gamma subunit complex., function: This is a membrane-bound, calmodulin-insensitive adenylyl cyclase., similarity: Belongs to the adenylyl cyclase class-4/guanylyl cyclase family., similarity: Contains 2 guanylate cyclase domains.,
