研究背景 (Background)

This gene encodes a flavoprotein essential for nuclear disassembly in apoptotic cells, and it is found in the mitochondrial

intermembrane space in healthy cells. Induction of apoptosis results in the translocation of this protein to the nucleus where it affects chromosome condensation and fragmentation. In addition, this gene product induces mitochondria to release the apoptogenic proteins cytochrome c and caspase-9. Mutations in this gene cause combined oxidative phosphorylation deficiency 6 (COXPD6), a severe mitochondrial encephalomyopathy, as well as Cowchock syndrome, also known as X-linked recessive Charcot-Marie-Tooth disease-4 (CMTX-4), a disorder resulting in neuropathy, and axonal and motor-sensory defects with deafness and mental retardation. Alternative splicing results in multiple transcript variants. A related pseudogene has been identified on chromosome catalytic activity: 2 glutathione + protein-disulfide = glutathione disulfide + protein-dithiol., cofactor: FAD., function: Possesses significant protein thiol-disulfide oxidase activity., function: Probable oxidoreductase that acts as a caspase-independent mitochondrial effector of apoptotic cell death. Extramitochondrial AIF induces nuclear chromatin condensation and large scale DNA fragmentation (in vitro). Binds to DNA in a sequence-independent manner., similarity: Belongs to the FAD-dependent oxidoreductase family., similarity: Contains 1 thioredoxin domain., subcellular location: Translocated to the nucleus upon induction of apoptosis., subunit: Interacts with XIAP., tissue specificity: Widely expressed.,
