研究背景 (Background)

The protein encoded by this gene was first identified by its ability to bind the adenovirus E1A protein. The protein localizes to

the nucleus. It functions as a transcriptional repressor, and expression of E1A inhibits this repression. Alternatively spliced transcript variants encoding different isoforms have been identified. [provided by RefSeq, Jul 2008],function: Binds to the transactivation domain of the adenovirus type 5 E1A 32 kDa protein (289R) and inhibits its transactivating activity. May act as tumor suppressor through suppression of adenovirus replication.,PTM: Phosphorylated upon DNA damage, probably by ATM or ATR.,similarity: Contains 1 bromo domain.,similarity: Contains 1 MYND-type zinc finger.,similarity: Contains 1 PHD-type zinc finger.,similarity: Contains 1 PWWP domain.,
