研究背景 (Background)

Calpains are ubiquitous, well-conserved family of calcium-dependent, cysteine proteases. The calpain proteins are heterodimers consisting of an invariant small subunit and variable large subunits. The large subunit possesses a cysteine

protease domain, and both subunits possess calcium-binding domains. Calpains have been implicated in neurodegenerative processes, as their activation can be triggered by calcium influx and oxidative stress. The protein encoded by this gene is expressed predominantly in stomach and small intestine and may have specialized functions in the digestive tract. This gene is thought to be associated with gastric cancer. Multiple alternatively spliced transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Jul 2008],catalytic activity:Broad endopeptidase specificity,,function:Calcium-regulated non-lysosomal thiol-protease,,induction:Down-regulated in gastric cancer tissue and in gastric cell lines of differentiated and poorly differentiated types,,similarity:Belongs to the peptidase C2 family,,similarity:Contains 1 calpain catalytic domain,,similarity:Contains 3 EF-hand domains,,tissue specificity:Expressed predominantly in stomach.,
