研究背景 (Background)

The protein encoded by this gene, a member of the peptidase S1 protein family, is found in azurophilic granules of neutrophilic polymorphonuclear leukocytes. The encoded protease has a specificity similar to that of chymotrypsin C, and may participate in

the killing and digestion of engulfed pathogens, and in connective tissue remodeling at sites of inflammation. In addition, the encoded protein is antimicrobial, with bacteriocidal activity against *S. aureus* and *N. gonorrhoeae*. Transcript variants utilizing alternative polyadenylation signals exist for this gene. [provided by RefSeq, Sep 2014], catalytic activity: Specificity similar to chymotrypsin C, enzyme regulation: Inhibited by soybean trypsin inhibitor, benzamidine, the synthetic peptide R13K, Z-Gly-Leu-Phe-CH₂Cl and phenylmethylsulfonyl fluoride. Inhibited by LPS from *P. aeruginosa* but not by LPS from *S. minnesota*, function: Serine protease with trypsin- and chymotrypsin-like specificity. Has antibacterial activity against the Gram-negative bacterium *P. aeruginosa*, antibacterial activity is inhibited by LPS from *P. aeruginosa*, Z-Gly-Leu-Phe-CH₂Cl and phenylmethylsulfonyl fluoride, similarity: Belongs to the peptidase S1 family, similarity: Contains 1 peptidase S1 domain,
