研究背景 (Background)

centrosomal protein 350(CEP350) Homo sapiens The product of this gene is a large protein with a CAP-Gly domain typically

found in cytoskeleton-associated proteins. The encoded protein primarily localizes to the centrosome, a non-membraneous organelle that functions as the major microtubule-organizing center in animal cells. The encoded protein directly interacts with another large centrosomal protein and is required to anchor microtubules at the centrosome. It is also implicated in the regulation of a class of nuclear hormone receptors in the nucleus. Several alternatively spliced transcript variants have been found, but their full-length nature has not been determined. [provided by RefSeq, Jul 2008],function:Required for anchoring microtubules to the centrosomes. Required for the integrity of the microtubule network. Recruits PPARG to discrete subcellular compartments and thereby modulates PPARG activity.,PTM:Phosphorylated during mitosis.,similarity:Contains 1 CAP-Gly domain.,subcellular location:Associated with mitotic spindles. Nuclear, in discrete foci. Associated with intermediate filaments.,subunit:Part of a ternary complex that contains CEP350, FGFR1OP and MAPRE1. Interacts directly with FGFR1OP via its C-terminus. Interacts with NR1H3, PPARG, PPARG and PPARG.,tissue specificity:Detected in heart, brain, skeletal muscle, testis, placenta, lung, liver, kidney and pancreas.,
