研究背景 (Background)

This gene product is a small calcium-binding protein that regulates cell pH by controlling plasma membrane-type Na⁺/H⁺

exchange activity. This protein shares sequence similarity with calcineurin B and can bind to and stimulate the protein phosphatase activity of calcineurin A (CnA) and functions in the calcineurin/NFAT (nuclear factor of activated T cells) signaling pathway. Another member of the CHP subfamily, Calcineurin B homologous protein 1, is located on Chromosome 15 and is an inhibitor of calcineurin activity and has a genetic phenotype associated with Parkinson's Disease (OMIM:606988). This gene was initially identified as a tumor-associated antigen and was previously referred to as Hepatocellular carcinoma-associated antigen 520. [provided by RefSeq, Jul 2013],function: Binds to and activates SLC9A1/NHE1 in a serum-independent manner, thus increasing pH and protecting cells from serum deprivation-induced death.,similarity: Contains 4 EF-hand domains.,subunit: Binds to SLC9A1/NHE1.,tissue specificity: Expressed in malignantly transformed cells but not detected in normal tissues.,
