研究背景 (Background)

This gene is a member of a gene family that encodes enzymes involved in both the metabolism of glutathione and in the transpeptidation of amino acids. Changes in the activity of gamma-glutamyltransferase may signal preneoplastic or toxic conditions in the liver or kidney. The protein encoded by this gene consists of a heavy and a light chain, and it can interact with CT120, a plasma membrane-associated protein that is possibly involved in lung carcinogenesis. [provided by RefSeq, Jul 2008], catalytic activity: (5-L-glutamyl)-peptide + an amino acid = peptide + 5-L-glutamyl amino acid., function: Cleaves glutathione conjugates., pathway: Sulfur metabolism; glutathione metabolism., similarity: Belongs to the gamma-glutamyltransferase family., subunit: Heterodimer composed of the light and heavy chains. The active site is located in the light chain (By similarity). Isoform 3 interacts with FAM57A., tissue specificity: Widely expressed, but at low level, except in the airway epithelial cells. Detected in brain, heart, kidney, liver, lung, spleen, testis and trachea.,

研究领域 (Research Area)

Taurine and hypotaurine metabolism; Selenoamino acid metabolism; Cyanoamino acid metabolism; Glutathione metabolism; Arachidonic acid metabolism;

注意事项 (Note)

For research use only.
