研究背景 (Background)

This gene encodes a member of the cytochrome P450 superfamily of enzymes. The cytochrome P450 proteins are monooxygenases which catalyze many reactions involved in drug metabolism and synthesis of cholesterol, steroids and other

lipids. This protein localizes to the endoplasmic reticulum. In rodents, the homologous protein has been shown to metabolize certain carcinogens; however, the specific function of the human protein has not been determined. [provided by RefSeq, Jul 2008],catalytic activity:RH + reduced flavoprotein + O(2) = ROH + oxidized flavoprotein + H(2)O.,cofactor:Heme group.,function:Has a potential importance for extrahepatic xenobiotic metabolism.,similarity:Belongs to the cytochrome P450 family.,tissue specificity:High level of expression in trachea, lung, stomach, small intestine, and spleen.,

研究领域 (Research Area)

Metabolism of xenobiotics by cytochrome P450;

注意事项 (Note)
