研究背景 (Background)

A high concentration of glucose can result in non-enzymatic oxidation of proteins by reaction of glucose and lysine residues (glycation). Proteins modified in this way, fructosamines, are less active or functional. This gene encodes an enzyme which catalyzes the phosphorylation of fructosamines which may result in deglycation. [provided by RefSeq, Feb 2012],function:May initiate a process leading to the deglycation of fructoselysine and of glycated proteins. May play a role in the phosphorylation

of 1-deoxy-1-morpholino-fructose (DMF), fructoselysine, fructoseglycine, fructose and glycosylated lysozyme.,similarity:Belongs to the fructosamine kinase family.,subunit:Monomer.,tissue specificity:Expressed in erythrocytes.,
