研究背景 (Background)

This gene encodes a member of the GIT protein family, which interact with G protein-coupled receptor kinases and possess ADP-ribosylation factor (ARF) GTPase-activating protein (GAP) activity. GIT proteins traffic between cytoplasmic complexes, focal adhesions, and the cell periphery, and interact with Pak interacting exchange factor beta (PIX) to form large oligomeric complexes that transiently recruit other proteins. GIT proteins regulate cytoskeletal dynamics and participate in receptor internalization and membrane trafficking. This gene has been shown to repress lamellipodial extension and focal adhesion turnover, and is thought to regulate cell motility. This gene undergoes extensive alternative splicing to generate multiple isoforms, but the full-length nature of some of these variants has not been determined. The various isoforms have functional differences, with respect to ARF GAP activity and to Galternative products:Additional isoforms seem to exist,function:GTPase-activating protein for the ADP ribosylation factor family.,similarity:Contains 1 Arf-GAP domain.,similarity:Contains 3 ANK repeats,subunit:Interacts with TGFB111 (By similarity). Interacts with G protein-coupled receptor kinases. Associates with paxillin. Also interacts with PIX exchange factors,.
