研究背景 (Background)

This locus encodes a member of the glycerate kinase type-2 family. The encoded enzyme catalyzes the phosphorylation of (R)-glycerate and may be involved in serine degradation and fructose metabolism. Decreased activity of the encoded enzyme may

be associated with the disease D-glyceric aciduria. Alternatively spliced transcript variants have been described. [provided by RefSeq, Jan 2009],catalytic activity:ATP + (R)-glycerate = ADP + 3-phospho-(R)-glycerate.,disease:Defects in GLYCK are the cause of D-glyceric acidemia [MIM:220120]. It is characterized by nonketotic hyperglycinemia with the excretion of D-glyceric acid in the urine and the presence of this substance in the serum.,similarity:Belongs to the glycerate kinase type-2 family.,tissue specificity:Widely expressed.,

研究领域 (Research Area)

Glycine; serine and threonine metabolism;Glycerolipid metabolism;Glyoxylate and dicarboxylate metabolism;
