研究背景 (Background)

This gene encodes a GTPase that triggers back-translocation of the elongating ribosome during mitochondrial protein

synthesis. The protein contains a highly conserved C-terminal domain not found in other GTPases that facilitates tRNA binding. The encoded protein is thought to prevent misincorporation of amino acids in stressful, suboptimal conditions. An allelic variant in this gene has been associated with early infantile epileptic encephalopathy-40. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Sep 2016],similarity:Belongs to the GTP-binding elongation factor family. LepA subfamily.,
