研究背景 (Background)

This gene encodes a protein containing tetratricopeptide repeats that was originally identified as induced upon treatment with

interferon. The encoded protein may inhibit viral replication and translational initiation. This gene is located in a cluster on chromosome 10 with five other closely related genes. There is a pseudogene for this gene on chromosome 13. Alternatively spliced transcript variants encoding multiple isoforms have been observed. [provided by RefSeq, Aug 2012],induction:By interferons.,similarity:Belongs to the IFIT family.,similarity:Contains 10 TPR repeats.,

研究领域 (Research Area)

注意事项 (Note)

For research use only.

图片 (Image Data)

Western blot analysis of lysates from LOVO cells, using IFIT1 Antibody. The lane on the right is blocked with the synthesized peptide.

Immunohistochemical analysis of paraffin-embedded Human brain. Antibody was diluted at 1:100 (4°,overnight) . High-pressure and temperature Tris-EDTA,pH8.0 was used for antigen retrieval. Negative contrl (right) obtained from antibody was pre-absorbed by immunogen peptide.
