研究背景 (Background)

Myosin light chain kinase and phosphatase (MLCP) complexes control the phosphorylation states of regulatory myosin light

chains, which is crucial for muscle and intracellular movement. MLCPs typically contain a catalytic protein phosphatase 1 (PP1c) subunit, a myosin phosphatase targeting (MYPT) subunit, and another smaller subunit. The protein encoded by this gene represents an MYPT subunit, which is responsible for directing PP1c to its intended targets. However, while other MYPTs result in PP1c activation after becoming phosphorylated, the encoded protein is phosphorylated by protein kinase A and then inhibits the catalytic activity of PP1c. [provided by RefSeq, Jul 2016],function:Inhibits protein phosphatase 1 activity toward phosphorylase, myosin light chain and myosin substrates.,sequence caution:Cloning artifact.,similarity:Contains 5 ANK repeats.,subunit:Bounds PP1.,
