研究背景 (Background)

This gene belongs to the neuron navigator family and is expressed predominantly in the nervous system. The encoded protein contains coiled-coil domains and a conserved AAA domain characteristic for ATPases associated with a variety of cellular

activities. This gene is similar to unc-53, a *Caenorhabditis elegans* gene involved in axon guidance. The exact function of this gene is not known, but it is thought to play a role in neuronal development and regeneration. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Nov 2009], developmental stage: Expressed in fetal brain and heart., function: May be involved in neuronal migration., similarity: Belongs to the Nav/unc-53 family., subcellular location: Associates with a subset of microtubule plus ends. Enriched in neuronal growth cones., subunit: Interacts with tubulin., tissue specificity: Broadly expressed at low levels. Expressed at high levels in heart, skeletal muscle and placenta.,
