研究背景 (Background)

The protein encoded by this gene is a receptor for neuropeptide Y and peptide YY. The encoded protein appears to be involved

in regulating food intake, with defects in this gene being associated with eating disorders. Also, the encoded protein is involved in a pathway that protects neuroblastoma cells from chemotherapy-induced cell death, providing a possible therapeutic target against neuroblastoma. Three transcript variants encoding the same protein have been found for this gene. [provided by RefSeq, Nov 2015],function:Receptor for neuropeptide Y and peptide YY. The activity of this receptor is mediated by G proteins that inhibit adenylate cyclase activity. Seems to be associated with food intake. Could be involved in feeding disorders.,similarity:Belongs to the G-protein coupled receptor 1 family.,tissue specificity:Brain; hypothalamus.,
