研究背景 (Background)

This gene encodes a member of the phospholipase D (PLD) family of enzymes that catalyze the hydrolysis of membrane

phospholipids. The encoded protein is a single-pass type II membrane protein and contains two PLD phosphodiesterase domains. This protein influences processing of amyloid-beta precursor protein. Mutations in this gene are associated with Alzheimer disease risk. Alternatively spliced transcript variants encoding the same protein have been found for this gene. [provided by RefSeq, Apr 2014], catalytic activity: A phosphatidylcholine + H₂O = choline + a phosphatidate., PTM: Glycosylated., similarity: Belongs to the phospholipase D family., similarity: Contains 2 PLD phosphodiesterase domains., tissue specificity: Widely expressed. Expresses at higher level in brain. Expresses at low level in corpus callosum, suggesting that it is highly expressed in neurons.,
