研究背景 (Background)

The protein encoded by this gene is similar to oxidoreductases, which are enzymes involved in cellular responses to oxidative

stresses and irradiation. This gene is induced by the tumor suppressor p53 and is thought to be involved in p53-mediated cell death. It contains a p53 consensus binding site in its promoter region and a downstream pentanucleotide microsatellite sequence. P53 has been shown to transcriptionally activate this gene by interacting with the downstream pentanucleotide microsatellite sequence. The microsatellite is polymorphic, with a varying number of pentanucleotide repeats directly correlated with the extent of transcriptional activation by p53. It has been suggested that the microsatellite polymorphism may be associated with differential susceptibility to cancer. Alternatively spliced transcript variants encoding different isoforms have been found for this gene. alternative products: UV radiation favors the production of isoform 2, function: May be involved in the generation of reactive oxygen species (ROS), induction: Isoforms 1 and 2 are both activated by TP53/p53, doxorubicin, etoposide and ionizing radiation. Isoform 2 is highly activated by UV radiation, similarity: Belongs to the zinc-containing alcohol dehydrogenase family. Quinone oxidoreductase subfamily,
