研究背景 (Background)

This gene encodes an endoplasmic reticulum associated protein that is involved in glycosylphosphatidylinositol (GPI)-anchor

biosynthesis. The GPI anchor is a glycolipid found on many blood cells and which serves to anchor proteins to the cell surface. The protein encoded by this gene is a subunit of the GPI N-acetylglucosaminyl (GlcNAc) transferase that transfers GlcNAc to phosphatidylinositol (PI) on the cytoplasmic side of the endoplasmic reticulum. [provided by RefSeq, Jul 2008], catalytic activity: UDP-N-acetyl-D-glucosamine + 1-phosphatidyl-1D-myo-inositol = UDP + 6-(N-acetyl-alpha-D-glucosaminy)-1-phosphatidyl-1D-myo-inositol., function: Part of the complex catalyzing the transfer of N-acetylglucosamine from UDP-N-acetylglucosamine to phosphatidylinositol, the first step of GPI biosynthesis., online information: Phosphatidylinositol N-acetylglucosaminyltransferase subunit H, pathway: Glycolipid biosynthesis; glycosylphosphatidylinositol-anchor biosynthesis., similarity: Belongs to the PIGH family., subunit: Associates with PIGA, PIGC, PIGP, PIGQ and DPM2. The latter is not essential for activity.,
