研究背景 (Background)

This gene encodes a transmembrane protein that contains a Smad interacting motif (SIM). Expression of this gene is induced by

androgens and transforming growth factor beta, and the encoded protein suppresses the androgen receptor and transforming growth factor beta signaling pathways through interactions with Smad proteins. Overexpression of this gene may play a role in multiple types of cancer. Alternatively spliced transcript variants encoding multiple isoforms have been observed for this gene. [provided by RefSeq, Dec 2011], domain: The WW-binding motifs mediate interaction with NEDD4, induction: By androgen, similarity: Belongs to the PMEPA1 family, subunit: Interacts with the WW domains of NEDD4, tissue specificity: Highest expression in prostate. Also expressed in ovary,
