研究背景 (Background)

This gene encodes a member of the PPM family of Mn^{2+}/Mg^{2+} -dependent protein phosphatases. The encoded protein, essential for cell survival and development, is targeted to the mitochondria where it plays a key role in regulation of the mitochondrial permeability transition pore. [provided by RefSeq, Sep 2012], catalytic activity: A phosphoprotein + H_2O = a protein + phosphate., caution: Ref.9 has crystallized PPM1K in the presence of magnesium ions. However, PubMed:17336929 reported that no activity toward p-nitrophenylphosphate was seen in the absence of manganese ions and magnesium could not substitute for manganese., cofactor: Binds 1 magnesium or manganese ion per subunit., function: Regulates the mitochondrial permeability transition pore and is essential for cellular survival and development., similarity: Belongs to the PP2C family., similarity: Contains 1 PP2C-like domain.,
