研究背景 (Background)

This gene encodes a member of the PPM family of serine/threonine-protein phosphatases. The encoded protein is localized to the nucleus and dephosphorylates and inactivates multiple substrates including serine/threonine-protein kinase PAK 1, 5'-AMP-activated protein kinase (AMPK) and the multifunctional calcium/calmodulin-dependent protein kinases. Alternatively spliced transcript variants have been observed for this gene. [provided by RefSeq, May 2012],catalytic activity:A

phosphoprotein + H₂O = a protein + phosphate.,cofactor: Binds 2 magnesium or manganese ions per subunit.,function: Protein phosphatase that inactivates multifunctional CaM kinases such as CAMK4 and CAMK2 (By similarity). Dephosphorylates and inactivates PAK. May play a role in the inhibition of actin fiber stress breakdown and in morphological changes driven by TNK2/CDC42.,similarity: Belongs to the PP2C family.,similarity: Contains 1 PP2C-like domain.,subcellular location: A truncated form, major form, with the C-terminal part missing, is mostly found in the cytoplasm and a little in the nucleus. The full length, minor form, is found in the nucleus.,subunit: Heterotrimer. Interacts with PAX1 and ARHGEF6 (or ARHGEF7),
