研究背景 (Background)

This gene encodes a member of the prefoldin beta subunit family. The encoded protein is one of six subunits of prefoldin, a molecular chaperone complex that binds and stabilizes newly synthesized polypeptides, thereby allowing them to fold

correctly. The complex, consisting of two alpha and four beta subunits, forms a double beta barrel assembly with six protruding coiled-coils. [provided by RefSeq, Jul 2008],function: Binds specifically to cytosolic chaperonin (c-CPN) and transfers target proteins to it. Binds to nascent polypeptide chain and promotes folding in an environment in which there are many competing pathways for nonnative proteins.,similarity: Belongs to the prefoldin subunit beta family.,subunit: Heterohexamer of two PFD-alpha type and four PFD-beta type subunits.,

研究领域 (Research Area)

Signal Transduction; Protein Trafficking; Chaperones; Other Chaperones; Epigenetics and Nuclear Signaling; Transcription; Transcription Factors
