研究背景 (Background)

septin 1(SEPT1) Homo sapiens This gene is a member of the septin family of GTPases. Members of this family are required for

cytokinesis and the maintenance of cellular morphology. This gene encodes a protein that can form homo- and heterooligomeric filaments, and may contribute to the formation of neurofibrillary tangles in Alzheimer's disease. Alternatively spliced transcript variants have been found but the full-length nature of these variants has not been determined. [provided by RefSeq, Dec 2012],function:Involved in cytokinesis ,similarity:Belongs to the septin family.,subunit:May assemble into a multicomponent structure.,
