研究背景 (Background)

This gene encodes a member of glycosyltransferase family 29. The encoded protein is a type II membrane protein that catalyzes

the transfer of sialic acid from CMP-sialic acid to galactose-containing substrates. The protein, which is normally found in the Golgi but can be proteolytically processed to a soluble form, is involved in the generation of the cell-surface carbohydrate determinants and differentiation antigens HB-6, CD75, and CD76. This gene has been incorrectly referred to as CD75. Three transcript variants encoding two different isoforms have been described. [provided by RefSeq, Aug 2009], catalytic activity: $\text{CMP-N-acetylneuraminate} + \text{beta-D-galactosyl-1,4-N-acetyl-beta-D-glucosamine} = \text{CMP} + \text{alpha-N-acetylneuraminy-2,6-beta-D-galactosyl-1,4-N-acetyl-beta-D-glucosamine}$, function: Transfers sialic acid from the donor of substrate CMP-sialic acid to galactose containing acceptor substrates., online information: GlycoGene database, online information: ST6Gal I, pathway: Protein modification; protein glycosylation., PTM: The HB-6, CDW75, and CD76 differentiation antigens are cell-surface carbohydrate determinants generated by this enzyme., PTM: The soluble form derives from the membrane form by proteolytic processing., similarity: Belongs to the glycosyltransferase 29 family., subcellular location: Membrane-bound form in trans cisternae of Golgi. Secreted into the body fluid.,
