研究背景 (Background)

The protein encoded by this gene is a member of the dual specificity protein phosphatase subfamily. These phosphatases

inactivate their target kinases by dephosphorylating both the phosphoserine/threonine and phosphotyrosine residues. They negatively regulate members of the mitogen-activated protein (MAP) kinase superfamily (MAPK/ERK, SAPK/JNK, p38), which are associated with cellular proliferation and differentiation. Different members of the family of dual specificity phosphatases show distinct substrate specificities for various MAP kinases, different tissue distribution and subcellular localization, and different modes of inducibility of their expression by extracellular stimuli. This gene maps in a region that contains the BRCA1 locus which confers susceptibility to breast and ovarian cancer. Although DUSP3 is expressed in both breast and ovarian tissues, mutation screening in breast cancer found no significant changes in DUSP3 expression. **activity:**A phosphoprotein + H₂O = a protein + phosphate.,**catalytic activity:**Protein tyrosine phosphate + H₂O = protein tyrosine + phosphate.,**function:**This protein shows activity both toward tyrosine-protein phosphate as well as with serine-protein phosphate.,**similarity:**Belongs to the protein-tyrosine phosphatase family. Non-receptor class dual specificity subfamily.,**similarity:**Contains 1 tyrosine-protein phosphatase domain.,
