研究背景 (Background)

The protein encoded by this gene is a transcription factor that upregulates expression of MDM2, which negatively regulates p53 expression. This gene is highly expressed in prostate cancer cells, which leads to a reduction in p53 levels and an increase in growth of the cancer cells. Several transcript variants have been found for this gene, but only one of them is protein-coding. [provided by RefSeq, Jan 2015],function:May function as a transcription factor.,PTM:Phosphorylated upon DNA damage,

probably by ATM or ATR.,similarity:Contains 4 C2H2-type zinc fingers.,
