研究背景 (Background)

Caution:It is not certain that ARS and ANUP are identical proteins.,Disease:Defects inSLURP1 are a cause of Mal de Meleda (MDM)[MIM:248300]; also known as keratosispalmoplantaris transgradiens of Siemens. MDM is a rare autosomal recessive skindisorder,characterized by diffuse transgressive palmoplantar keratoderma with keratotic lesionsextending onto the dorsa of the hands and the feet (transgrediens). Patients may havehyperhidrosis. Other features include perioral erythema, lichenoid

plaques on the knees and the elbows, and nail abnormalities. Function: Has an antitumor activity. Was found to be a marker of late differentiation of the skin. Implicated in maintaining the physiological and structural integrity of the keratinocyte layers of the skin. Induction: Regulated by retinoic acid, epidermal growth factor and interferon-gamma. Similarity: Contains 1 UPAR/Ly6 domain. Subunit: Homodimer. Tissue specificity: Granulocytes. Expressed in skin. Predominantly expressed in the granular layer of skin, notably the acrosyringium. Identified in several biological fluids such as sweat, saliva, tears, plasma and urine.
