研究背景 (Background)

Induces the contraction of smooth muscle, increases vascular permeability and causes histamine release from mast cells and

basophilic leukocytes. Non-enzymatic component of C3 and C5 convertases and thus essential for the propagation of the classical complement pathway. Covalently binds to immunoglobulins and immune complexes and enhances the solubilization of immune aggregates and the clearance of IC through CR1 on erythrocytes. C4A isotype is responsible for effective binding to form amide bonds with immune aggregates or protein antigens, while C4B isotype catalyzes the transacylation of the thioester carbonyl group to form ester bonds with carbohydrate antigens.

研究领域 (Research Area)

Immunology; Innate Immunity; Complement; Classical Pathway

注意事项 (Note)

For research use only.
